Keywords: Children, Online education, Literature course

Abstract: COVID-19 has a positive effect on online education. With the upgrading of technical means, it is a very advantageous choice to strengthen the education and guidance of children literature through online education. This paper focuses on the advantages and disadvantages of online education. On the basis of this analysis, combined with the characteristics of children, the paper puts forward some points to be paid attention to.

1. Introduction

Online education is a big market. Since last, the development of online education has been further promoted by reasons such as being unable to go out. In particular, the online education market for children is expanding. Last year's NPC and CPPCC sessions were in a special period of anti epidemic, and the representatives paid more attention to all fronts related to the fight against the epidemic than ever before. This makes online education become the hot spot of the two sessions for the first time. According to the data of public opinion of the two sessions, a total of 31 representatives made suggestions on online education, which aroused widespread concern of the society. If we zoom in on the whole epidemic period, we will find that online education has always been the focus of education public opinion. From major media to all kinds of we media, the topic of online education has always been the focus.

In the process of children's growth, the topic of education has always been concerned. With the continuous development of Internet technology, children's online education is no longer a new thing for people, especially with the change of external environment such as two child policy and family income, the demand for children's online education is also increasing. Especially during the epidemic period, in order to ensure the normal learning activities of children, many parents choose to use the relevant courses of online education platform as assistance and supplement, and the major online education platforms have made efforts to seize the traffic dividend in the special period. How to better choose the form of online education to achieve the desired purpose is a topic that needs to be concerned.

2. Online education and its characteristics

2.1 Low cost and convenient

Online education has a relatively low learning cost, and the average cost is equivalent to 50% to 80% of the on-site learning. Besides, it can be studied anytime and anywhere. Besides special circumstances, it is not limited by time and space, but also can save the cost of road and training place. At the same time, learning does not affect other learning tasks in the same period, saving a lot of additional costs, and the same cost can learn more. The learning content is updated quickly. Without worrying about the backup and synchronization of learning materials, it can be stored on the server automatically. The disadvantage is that the network environment is required to be high.

2.2 Repeatable

The learning form of online education can provide repeated learning service. Students can listen to or learn according to their own learning needs, better grasp the learning content and fully consolidate the learning effect. The advantage is that for the key and difficult content, it helps to understand and master thoroughly through repeated learning and thinking, avoiding the problems

that are easy to be forgotten in classroom learning, and also easy to make the students rely on psychology, which leads to the decline of learning efficiency.

2.3 Autonomous learning

The characteristics of autonomous learning in online education are more obvious. Advantage, because can't face to face with the teacher, children's psychological dependence on the teacher greatly weakened, will gradually cultivate the concept of "learning by myself". This actually urges students to establish their dominant position in the learning process. Online education liberates children from time and space, and the relaxed learning atmosphere can make them play their intelligence and initiative. Online education promotes children to develop independent thinking ability and critical and research-oriented learning. The disadvantage is that the students' learning ability and self-discipline ability are required to be high, and the teachers' on-site guidance and constraints are lacking.

2.4 Personalized learning

Online education can realize personalized learning well. Students can arrange their own learning progress according to their own time, choose learning content according to their own needs, knowledge background, personal preferences and learning style, effectively enhance the learning pertinence, thus improving the learning efficiency of individuals. Advantages: first, you can choose the content that your child needs and study targeted. Second, according to the children's own learning effect, whether to continue to study and consolidate the existing knowledge or should learn new knowledge, make judgments and choices. Third, it is highly efficient. Generally, the initiative of content learning of self-choice will be relatively high, and the learning efficiency will be improved naturally. This also requires that children have a clear goal and direction, otherwise they will not know what to learn and how to learn.

2.5 Rich interaction and cooperation

Online education can facilitate the communication and cooperation between students, and communicate their ideas with others in time. Advantages: when discussing problems, we will have more and better solutions when we gather our ideas and ideas. Second, the mutual help and cooperation between students will greatly broaden everyone's vision and broaden the knowledge structure. Third, more and more online teaching functions make students more convenient and faster to master knowledge, and shorten the time from receiving to practicing to mastering knowledge. The disadvantage is that network communication is not as efficient as face-to-face communication.

3. Design of Chinese course in children online education

3.1 To spread the correct values

The education of socialist core values is very important, and it is also an important measure to cultivate and shape the values of our country's youth. The core socialist values need to be integrated and embodied in the whole process of national education. Therefore, in the online education for children, we should conform to the party's educational policy and the requirements of establishing morality and cultivate people in terms of ideological, scientific and adaptive aspects, and embody the quality education orientation, and do not include obscenity, violence, terror, gambling and online games unrelated to learning, and shall not publish, print, reproduce and issue illegal publications, and engage in infringement and piracy activities . The curriculum should be designed to meet the cognitive ability of the students' physical and mental development laws. The training content of the subject courses should not exceed the corresponding national curriculum standards, and should be compatible with the students' individual ability and cognitive ability. We should take socialist core value as a teaching content, and integrate it into online education through the way of both pictures and texts, enjoying and receiving easily, so as to achieve the purpose of educating people.

3.2 To highlight the literariness

The cultivation of literary literacy is very important to children, and people who have solid literary background generally receive very good literary training in the early childhood. The purpose of children is to train the new people who are in charge of the national rejuvenation, and must carry out literature training from a small age. At present, school education has noticed this point, and in preschool and primary education, it pays attention to the implantation and training of simple literary poetry and so on. Online education learning is just learning form from offline to online, there is no essential difference. The following points can be noted during the course setting. First, we should start with basic poetry, such as arranging widely spread classics such as three character classics and Bai Jia surname in the study contents at the age of 1-3. Children are not required to fully understand their meaning, but only memorize them hard, grasp them slowly in the follow-up study, and arrange literature training courses such as Tang poetry and Song Ci appropriately at other corresponding stages. Second, we should highlight the interest and attraction. Children are poor in their study focus, which is also the characteristics of children, so we need to take targeted measures to solve them.

3.3 We should pay attention to the intervention of traditional culture

Traditional culture is the root of Chinese culture. General secretary Xi Jinping attached great importance to Chinese excellent traditional culture, and proposed to achieve creative transformation and innovative development. The infiltration and value shaping of traditional culture on children, as well as the future development are unparalleled. At present, China has also continued to rise the craze of Sinology, which is also the manifestation of the revival of traditional culture. Now the rise of all kinds of traditional culture programs is also such a manifestation. Online education has multiple forms, which is more beneficial to the mobilization and utilization of resources than offline classroom education, but it also has some shortcomings. At the beginning, face-to-face education cannot be realized, online remote interaction is insufficient, and the understanding of traditional culture is difficult to be thorough. All these require the following points. First, we should teach students in accordance with their aptitude in setting up the curriculum content. Two, we must try to extract the essence of traditional culture and absorb the essence of it so that children can absorb it. The third is to activate and utilize the online resources as much as possible, which has more impact and appeal in the form of presentation.

3.4 Pay attention to the scientific nature of education

Scientificity is the basis and premise of education. Without scientific educational methods, we often get half the result with twice the effort. Therefore, in the face of children's education process, we should pay special attention to these. In terms of scientificity, we should improve from the use of technical equipment and facilities, that is, the use of new media resources, and also from the curriculum. First, to flexibly use new technology and equipment, efforts must be made in equipment sharing and technology docking. The second is to integrate the knowledge of psychology, pedagogy and sociology into the curriculum, so as to make the online education for children more scientific and dynamic through comprehensive education.

4. Conclusion

As a new form of education, online education has its own characteristics and advantages, which reflects the improvement of education methods and means. Its convenience, interactivity and interactivity are unique, but its disadvantages and shortcomings are also obvious, such as not conducive to students' accurate grasp of curriculum objectives. The curriculum education of literature for children should be improved by comprehensive use of technical means and teaching means, especially teaching students in accordance with their aptitude. Targeted education measures should be made for children of different ages, different learning stages and different receiving abilities, so as to maximize the effect of online learning education.
