Keywords: grey theory; GM model; new format; industrial integration

Abstract: The analysis method in this paper based on grey theory, constructs the tourism industry and commerce, health, study and leisure, emotional and adventure and other industrial integration GM (1,1) model, according to the tourism industry and related industries integration of the original data, the analysis of grey correlation theory. The analysis results show that six related new tourism industry and tourism industry is higher, can promote each other, and the fusion of local tourism industry development strengthens the construction of tourism industry chain, which has certain reference significance to the sustainable development of local tourism industry.

1. Introduction

With the continuous adjustment of industrial structure, the local third industry is playing an increasingly important role in promoting economic growth, increasing local fiscal revenue and absorbing labor force and employment. Strengthening the third industry has become an important direction for the effective, lasting, healthy and stable development of local economy. With the deepening of the convergence and development of local tourism industry, the concept of sustainable development is deeply rooted in the hearts of the people. The arrival of the era of mass tourism brings new opportunities for the development of tourism industry. Based on the grey theory analysis method, this paper calculates and analyzes the integration development of local tourism industry, aiming to provide some references for the sustainable development of local tourism industry.

2. Overview of Grey Theory

System analysis refers to the two or more elements of a certain association that have a specific use of the whole. In the analysis of specific problems, people may only get a small part of information in the analysis object, and can not get all the information. In this state, we use a few data to establish an uncertain and complex problem called grey theory. In short, grey theory refers to a fuzzy system that studies "a small number of known and unknown information", and obtains key information from a small amount of information, so as to achieve understanding and prediction of system behavior and evolution. The grey theory is referred to as the GM (1,1) model, and its description equation is as follows:

\[ x^{(0)}(k) + \alpha z^{(1)}(k) = u \]  

(1)

In the formula (1), \( x^{(0)}(k) \) is a grey guide value; \( \alpha \) is the development coefficient; \( z^{(1)}(k) \) is a whitening background value; \( u \) is the value of ash action.

The integration of local tourism industry is a new type of tourism service mode. It is upgrading and improvement of traditional tourism industry, and a new way of tourism development. In recent years, this part of the business market is relatively unstable and data is scarce. Linear regression analysis can not solve this problem. The grey system emphasizes the "little data modeling", so this paper uses the grey system to study the problem of local tourism industry integration.

3. Conditions for the integration of local tourism industry

Based on the current integration of tourism industry in China, local tourism industry can
integrate new industries to promote the development of local tourism and meet the needs of tourists in the new era by increasing other industries. The local tourism industry, driven by the market demand and the development of industrial integration, has formed a number of new types of tourism integration. This type of tourism integration because of the difference of function, technology and characteristics of the tourism industry, and the correlation and difference, therefore, the way and method of integration of the tourism industry is also very different, generally divided into resource integration, technology integration, function integration and market integration of four kinds of path. Taking function as a blending path to highlight a certain function of local tourism industry, it brings new opportunities to tourism industry and brings better functional benefits, making the two industries get better development. This paper, taking social function and function as the breakthrough point, carries out the integration of tourism industry with function as the way of communion.

With function as the breakthrough point of tourism industry integration, the new forms of local tourism include three forms of agricultural integration, industrial integration and third industry integration. Among them, agricultural integration includes fruit planting base, scenic area, wetland park and hot spring resort. Industrial integration includes business visits, industrial parks and economic development zones. The third industry integration includes manor, theme park and local cultural characteristics. On the basis of local "eat, live, travel, travel, buy, amuse" and so on, expand the new tourism industry, such as "business, cultivation, learning, leisure, love, strange" and other new forms of tourism. The new integration of local tourism is as shown in Table 1.

<table>
<thead>
<tr>
<th>Serial number</th>
<th>Essential factor</th>

</table>

As shown in Table 1, there are many forms and categories of function integration for tourism industry. For example, sports tourism, which belongs to elements in the table, is mainly for tourists to improve their health and eliminate fatigue in the process of tourism, so as to achieve physical and mental satisfaction and relaxation. The combination of sports and tourism brings more benefits to tourists and makes the additional functions of tourism integration fully display and play. In addition, sports tourism has also brought new opportunities for development to the sports industry. In addition, in order to function as the theme of tourism integration and business, study and leisure, emotional and adventure etc..

4. Research on the integration and development of local tourism industry

grey theory method has been used in this paper, the tourism industry and commerce, health, science, research the close degree of leisure, emotional and adventure industries are calculated and analyzed, and according to the analysis results give recommendations on integration and development of local tourism industry. The degree of integration of local tourism industry and related industries directly reflects the degree of integration, the greater the degree of association and the higher the degree of integration.
4.1 Index selection

In the course of the study of grey theory, tourism industry to increase the value of Y, the fusion industry respectively for business, health, study and leisure, emotional and adventure industries. Among them, the total income of the tourism industry (X1), number of travel agencies (X2), the total number of star hotels (X3), business, health, study and leisure, emotional and adventure etc. industrial added value respectively (X4), (X5), (X6), (X7), (X8) and (X9). The data of the tourism industry and related integration industry are shown in Table 2.

4.2 Correlation analysis of Grey Theory

According to the grey theory GM (1,1) model, the calculation is as follows:

(1) Reference sequence \( Y(t) \) and comparison sequence \( X_i(t) \) \( (i=1,2,...,9) \).

(2) According to the different measurement units of the data, the data are processed without Dimensionalization, and the comparability between the factors is enhanced.

(3) Calculate the parameters of each sequence and comparative sequence difference, and calculated the maximum and minimum value of \( \delta_{\text{min}} \) \( \delta_{\text{max}} \);

(4) Set the resolution coefficient \( \rho \) is 0.5;

(5) The correlation coefficient \( R_i(t) \) is obtained, and the calculation formula is as follows:

\[
R_i(t) = \frac{\min|Y(t) - X_i(t)| + \rho \max|Y(t) - X_i(t)|}{\max|Y(t) - X_i(t)| + \rho \min|Y(t) - X_i(t)|}
\]  

(6) The result of Correlation degree \( r_i = \frac{1}{8} \sum_{i=1}^{4} R_i(t)(i=1,2,3,4) \) is shown as Table 3.

Table 3 Correlation between tourism industry and related integrated industry

<table>
<thead>
<tr>
<th>Index</th>
<th>X1</th>
<th>X2</th>
<th>X3</th>
<th>X4</th>
<th>X5</th>
<th>X6</th>
<th>X7</th>
<th>X8</th>
<th>X9</th>

</thead>
<tbody>
<tr>
<td>Correlation degree</td>
<td>0.842</td>
<td>0.682</td>
<td>0.663</td>
<td>0.849</td>
<td>0.781</td>
<td>0.826</td>
<td>0.898</td>
<td>0.682</td>
<td>0.661</td>
</tr>
</tbody>
</table>

Can be seen from table 3, the tourism industry and commerce, health, study and leisure, emotional and adventure and other related industry related degree from large to small order of \( X_7 > X_4 > X_6 > X_5 > X_8 > X_9 \); among them, business, study and leisure and Tourism Industry Association in more than 0.8 the other; associated with the tourism industry is relatively low, but more than 0.6, which indicated that the fusion of the industry and the tourism industry are very good, can promote the mutual development. In addition, according to the correlation shows that the tourism integration in local tourism, leisure should be appropriate to increase the proportion of fusion fusion had decreased.

5. Conclusion

In this paper, in the industrial integration has become the foundation of local tourism industry
development of new formats, using the gray theory to the tourism industry and commerce, health, science, research the close degree of leisure, emotional and adventure industries are calculated and analyzed. The results indicate that correlation of all six new tourism industry and tourism industry are more than 0.6, which indicated that the fusion of the industry and the tourism industry are very good, can promote each other, the result of the fusion of local tourism industry development, strengthen the construction of tourism industry chain, has a certain significance.
