Keywords: Intellectual property rights; Economic growth; International cooperation

Abstract: In the era of knowledge economy in the 21st century, intellectual property rights are increasingly becoming an important part of the core competitiveness of countries, enterprises and individuals. With the deepening of globalization, intellectual property protection not only affects the domestic innovation environment and economic growth, but also becomes an important issue in international cooperation and competition. As a world economic power, strengthening the protection of intellectual property rights in China is of great significance for promoting high-quality economic growth. This paper studies the relationship between intellectual property protection and high-quality economic growth, combs the research status at home and abroad, and clarifies the importance of intellectual property protection. By comparing the practice of intellectual property protection at home and abroad, the article also puts forward a series of targeted strategies and suggestions, aiming at perfecting the intellectual property protection system in China and promoting the economic growth to a higher quality.

1. Introduction

In the modern economic system, intellectual property rights have become the core element to promote economic growth and enhance national competitiveness. Intellectual property protection is not only the recognition and guarantee of innovation achievements, but also an important means to stimulate innovation and promote scientific and technological progress [1]. With the rise of knowledge economy and the acceleration of globalization, the importance of intellectual property protection has become increasingly prominent. High-quality economic growth is an important goal of China's current economic growth [2]. Strengthening the protection of intellectual property rights is the most important content to improve the property rights protection system and the biggest incentive to improve economic competitiveness. To achieve high-quality economic growth, we need to rely on innovation to improve the overall quality and competitiveness of the economy through technological innovation and industrial upgrading [3]. Intellectual property protection, as an important institutional guarantee to stimulate innovation, is of great significance for promoting high-quality economic growth.

However, the relationship between intellectual property protection and high-quality economic growth is complex and subtle [4]. On the one hand, strengthening intellectual property protection can stimulate innovation, promote technology transfer and diffusion, and provide a steady stream of power for high-quality economic growth; On the other hand, excessive or improper protection of intellectual property rights may lead to technical blockade, market monopoly and other consequences that are not conducive to high-quality economic growth [5]. Therefore, how to scientifically and reasonably protect intellectual property rights and play its role in promoting high-quality economic growth is a problem worthy of in-depth study. This paper will focus on the effect of intellectual property protection on high-quality economic growth, explore the relationship between them, sort out the mechanism path of intellectual property protection affecting high-quality economic growth, and contribute to building a more scientific, reasonable and efficient intellectual property protection system.

2. The impact mechanism of intellectual property protection on high-quality economic growth

2.1. Technology innovation mechanism

Intellectual property protection has a positive impact on high-quality economic growth by stimulating innovation and technology research and development. First of all, intellectual property protection provides innovators with an opportunity to monopolize the market, ensuring that they can get economic returns from innovation, thus stimulating the enthusiasm of enterprises and individuals for technological innovation [6]. Secondly, intellectual property protection promotes technology transfer and diffusion. A strong protection system is conducive to building a trust and stable environment, making enterprises more willing to carry out technical cooperation and exchanges, and promoting the dissemination and application of advanced technologies. All these are conducive to improving the overall technical level and competitiveness of the economy and promoting the development of the economy to high quality.

2.2. Industrial upgrading mechanism

Intellectual property protection also plays an important role in industrial upgrading. First of all, intellectual property protection helps to cultivate and protect emerging industries [7]. By ensuring that innovation results are fully protected, enterprises and individuals have more incentive to invest in emerging industries and fields and promote the upgrading of industrial structure to high-end and intelligent direction. Secondly, intellectual property protection has promoted the transformation and upgrading of traditional industries. Under the protection of intellectual property rights, traditional industries can upgrade their technology and replace their products by introducing advanced technology and strengthening independent research and development, so as to improve their added value and market competitiveness.

2.3. International trade mechanism

Intellectual property protection has an important impact on the process of international trade and economic globalization [8]. First of all, the protection of intellectual property rights helps to enhance China's position and competitiveness in international trade. By strengthening intellectual property protection, enterprises can better protect their own innovation achievements, prevent intellectual property infringement, and improve the reputation and competitiveness of products in the international market. Secondly, intellectual property protection promotes international trade and technical cooperation. Under the condition that intellectual property rights are fully protected, domestic and foreign enterprises are more willing to carry out technical exchanges and cooperation, so as to promote China's industry to integrate into the global innovation chain and value chain and realize a higher level of economic opening and development.

3. Case analysis at home and abroad

(1) United States

The United States has always attached great importance to intellectual property protection and established a strong patent protection system. This protection system provides sufficient rights and interests protection for innovators and attracts global investment and talents. This makes the United States in a leading position in technological innovation and industrial upgrading, and promotes the high-quality development of the economy.

(2) Germany

Germany pays attention to the judicial protection of intellectual property rights, which provides a strong legal guarantee for intellectual property rights. This protection strategy protects the innovation achievements of enterprises and ensures the fairness of market competition. Therefore, German enterprises have made remarkable achievements in technological innovation and brand building, laying a solid foundation for high-quality economic growth.

(3) China

In recent years, China has also made great progress in intellectual property protection. The

government has strengthened the construction of the legal system of intellectual property rights and intensified the crackdown on infringement. These measures have improved the domestic innovation ability and promoted the development of high-tech industries. With the strengthening of intellectual property protection, China's economic strength and international influence are also constantly improving.

Table 1 Cases of intellectual property protection and high-quality economic growth

case	Country/Region	Main measures of intellectual property protection	Effect of high-quality economic growth
Intellectual Property Protection in the United States	United States	Establish a strong patent protection system	Promote high-quality economic growth through technological innovation and attracting global investment and talents.
Judicial Protection of Intellectual Property in Germany	Germany	Attach importance to the judicial protection of intellectual property rights and ensure the fairness of market competition.	Protect the innovation achievements of enterprises, promote technological innovation and brand building, and achieve stable economic growth.
Construction of China's Intellectual Property Law System	China	Strengthen the construction of intellectual property legal system and crack down on infringement.	Enhance innovation ability, promote the development of high-tech industries, and enhance economic strength and international influence.

Table 1 shows the case comparison between intellectual property protection and high-quality economic growth. As can be seen from the above cases, intellectual property protection is an important means to promote high-quality economic growth. The strategies and measures adopted by different countries in intellectual property protection have provided strong support for their high-quality economic growth. Only by establishing a perfect intellectual property protection system can we really stimulate the vitality of innovation, promote industrial upgrading and achieve high-quality economic growth. Intellectual property protection is a long-term and complicated process, which requires the joint efforts of the government, enterprises and the whole society to build a truly effective protection system.

4. Strategies and suggestions

When formulating intellectual property protection strategies, it is necessary to comprehensively consider the domestic and international environment, development stages and characteristics of various industries. We should further improve intellectual property laws and regulations to ensure that they are in line with the development of the times, strengthen law enforcement, severely crack down on infringement and ensure the effective implementation of laws and regulations. Intellectual property protection should focus on stimulating innovation and realize the value transformation of intellectual property through market mechanism [9]. The government can guide financial institutions to increase their support for innovative enterprises, promote intellectual property pledge financing and other measures to promote the market-oriented operation of intellectual property rights. Intellectual property protection is a global challenge and requires the joint efforts of all countries. China should actively participate in international intellectual property cooperation, strengthen exchanges with other countries, and jointly create a fair, just and open intellectual property protection environment. At the same time, learn from international advanced experience and practices to further improve its own intellectual property protection system. Table 2 shows a summary of intellectual property protection strategies and suggestions.

Table 2 Intellectual property protection strategies and suggestions

Strategies/suggestions	Content overview
Improve the system of laws and regulations	Establish intellectual property laws and regulations that are compatible with the development of the times, strengthen law enforcement, and ensure effective implementation.
Incentive innovation and market mechanism	Realize the value transformation of intellectual property rights through market mechanism, guide financial institutions to support innovative enterprises, and promote intellectual property pledge financing.
Strengthen international cooperation and exchanges.	Participate in international intellectual property cooperation, work with other countries to create a good intellectual property protection environment, and learn from international advanced experience.
Raise the awareness of social protection.	Intensify publicity, popularize intellectual property knowledge, raise public awareness of protection, and encourage enterprises to establish internal intellectual property management systems.
Strengthen the cultivation and introduction of professional talents	The government, universities and enterprises jointly cultivate and introduce intellectual property talents, establish a perfect talent incentive mechanism, and attract more talents to join the protection cause.

Practitioners need to increase publicity, popularize intellectual property knowledge through media, education and other channels, and raise public awareness of protection. Encourage enterprises to establish an internal intellectual property management system, strengthen staff training, and form a corporate culture that respects and protects intellectual property rights. Intellectual property protection needs the support of professional talents. The government, universities and enterprises should jointly increase the training and introduction of intellectual property talents and build a high-quality and professional intellectual property protection team. At the same time, establish a perfect talent incentive mechanism to attract more talents to join the cause of intellectual property protection. We should strengthen the protection of intellectual property rights by strengthening the protection system, encouraging innovation and market mechanism, and strengthening international cooperation. By raising the awareness of social protection and strengthening the training and introduction of professionals, we will jointly provide a solid guarantee for high-quality economic growth.

5. Conclusions

The importance of intellectual property protection to economic and social growth cannot be ignored. In the modern economic system, intellectual property rights are not only the legal protection, but also the core driving force to stimulate innovation vitality, promote scientific and technological progress and industrial upgrading. A sound and efficient intellectual property protection system can ensure that innovators get the rewards they deserve, and then attract more resources to invest in R&D and innovation. From case studies at home and abroad, we can see the positive impact of intellectual property protection on high-quality economic growth. This includes not only the cultivation of emerging industries and the upgrading of traditional industries, but also the consolidation of national status and the enhancement of international competitiveness in international trade. It is worth mentioning that intellectual property protection is not isolated. It needs to be combined with technological innovation, market mechanism, international cooperation and other strategies to form a joint force and maximize its role in promoting high-quality economic growth. On the way to achieve this goal, we need the joint participation and efforts of the whole society and the whole chain. The government should continue to improve laws and regulations and strengthen law enforcement; Enterprises should establish internal mechanisms to train professionals and ensure that their rights and interests are not infringed; Educational and research institutions

should strengthen publicity and training to enhance the awareness of intellectual property protection in the whole society.
