Keywords: Computer, Database Technology, Information Management

Abstract: the Application of Computer Database Technology in Information Management is Analyzed. Its Main Purpose is to Understand the Current Development of Computer Database Technology and Its Application in Information Management. in the Current Stage of Rapid Economic and Cultural Development, All Areas of Society Are Concerned. in Recent Years, as One of the New Technologies, the Computer Database Technology is Widely Used in Various Industries and Occupies a Very Important Position. Affected by Many Factors, There Are Still Some Enterprises Lack of Understanding of Information Management and Computer Database Technology. in This Study, Firstly, the Development Characteristics of Computer Database Technology Are Analyzed, and the Application of Computer Database Technology in Information Management is Mainly Studied.

1. Introduction

Since Opening Up to the Outside World, China Has Gradually Entered the Internet + Era. in This New Development Situation, the Strength of China's Comprehensive Countries Has Been Greatly Improved, and Scientific and Technological Research and Development Has Been Strengthened. Computer Database Technology is One of the New Technologies Obtained under the Upgrading of Science and Technology. the Application of This Technology in Different Industries Can Effectively Realize the Scientific Management of Trust in Different Industries. It Has a Very Important Impact on Improving the Level of Information Management and Reducing the Defects of Information Management. This Article Mainly Discusses the Use of Computer Database Technology in Information Management, Which Will Lay a Solid Foundation for Improving the Application Level of Computer Database Technology in Information Management in the Future.

2. Computer Database

2.1 Internal Situation

Computer Database Technology is the Representative of Modern Technology Which Depends on Network. the Work of Computer Database Technology, Especially Getting Data Signals, Collecting a Lot of Data. the First is to Store Data in a Network Database. the First is to Analyze and Process Data. Computer Database Technology is the Product of Modern Technology and Computer Theory. with the Development of Market Economy, the Level of Network Information Technology Continues to Improve, and the Application Scope of Database Technology Continues to Expand[1]. It Not Only Optimizes the Design of Information Management System, But Also Provides Guidance for the Production Activities of Enterprises That Output Text Content Rapidly.

2.2 Characteristics

The first computer database has certain rules, many data are stored in it, and the stored data are regular. In many cases, different data sources have different organizational forms. Databases can integrate data in a unified organizational form, highlight similar features, and sort data cans. Second, open computer database technology. The database is semi open[2]. If the database is shut down completely, it is not the actual value. You need to record the user's key information when you start

setting up the database. The user needs to log in his account and enter his password. He can automatically enter the database and view the information of relevant departments. Third, the separation of computer database technology. Computer database technology is often combined with other technologies, but it is not affected by other technologies[3]. From a physical point of view, the hardware and software of computer database technology do not conflict with other technologies. From the logical point of view, the logical structure of computer database technology is difficult to change. In addition, the database technology of computer is volatile[4]. The data in the database is not static, and users can manage the data effectively. Society is in a state of change, and historical data gradually fails, becoming redundant data. Users can swipe this data. At the same time, users can check the accuracy of data and modify the wrong data in the query process.

3. Development Characteristics of Computer Database Technology

3.1 Organization

In the development of computer database technology, it has a clear organization and sharing. When used, the organization of the computer database is reflected in the fact that the database data is in disorder. Therefore, according to the characteristics of data, all data can be connected to a specific organizational structure in turn, data collection, and computer data information integration processing. The complexity of computer database is reflected in the ability of different units or countries to share database information on computers[5]. The database technology of computer must depend on the corresponding network technology. Because network technology is universal and widely used, computer information can be widely used and data from different regions can be widely distributed through the support of network technology.

4. Implementation Method of Computer Database Technology in Information Management

4.1 Operation

Nowadays, computer database technology plays an increasingly important role in information management. Economic development promotes the improvement of technical level, and computer database technology is used for business management[6]. At present, computer database technology has expanded from industry and commerce to agriculture and service. This technology enriches the content of information management, optimizes the method of information management, and promotes the rapid development of the industry. Second, the application of computer database technology in information management is very good. With the rapid development of science and technology in China, the scope of database continues to expand, and data processing is faster and better. Compared with other emerging technologies, the application of computer database technology is more convenient, data processing efficiency is high, and can meet the strict requirements of various industrial data processing[7]. Third, the risk of applying computer database technology to information management is greatly reduced. At the beginning of the application of computer database technology, data loss and data theft are decreasing day by day, and information management is obviously improved. A lot of data have the secret characteristics that are directly related to the survival of enterprises. To encrypt secure data, the company optimized its computer security system. In this case, the computer database technology is guaranteed, and the functions of data backup, data recovery and data protection are better.

4.2 Implementation

First of all, in order to improve the application level of computer database technology in information management, more technical funds should be invested[8]. Compared with foreign countries, China's information management level is low, so it is necessary to improve the security of computer data. In order to solve this problem, China must increase the cost of technology and promote the innovation of computer database technology[9]. Specifically, first of all, enterprises need to have the necessary security awareness, improve enterprise awareness, build network

security protection system, and carry out central network information management. Secondly, the overseas experience of information management is worth studying to ensure the security of information management. Third, computer hardware and software equipment need to be optimized to expand the size of the database. And we should standardize the data storage process and improve the position of computer database technology in information management. China's economic ties with other countries have continued to grow. For enterprises, we must record the domestic market information, production and operation of enterprises in the database, and also record the same information of enterprises in foreign markets. In the process of inputting information, we need to ensure the correctness of enterprise data. Specifically, first of all, a special data input group must be established to analyze the reliability of data [10]. Second, enterprises should give full play to the effectiveness of regulatory authorities, and conduct dynamic monitoring of data input. Third, enterprises should form database management standards. Third, in order to improve the application level of computer database technology in information management and promote the combination of theory and practice. China's computer database technology is not mature. In order to verify the theory of technology, it must be applied to the practice of information management. Specifically, it will optimize the theoretical system of enterprise database and apply new technology in information management based on independent development. Second, the enterprise shall record the results of information management business and make up for the defects of computer database technology in a timely manner.

Fig.1 Computer Data Analysis

4.3 Improve the Security of Computer Database Technology in Information Management

In the application of computer database technology in information management, the security of computer database technology in information management should be improved completely according to the actual development of computer database. By analyzing the past use of computer database technology, we will find the corresponding defects in application security. Therefore, when this technology is applied to information management, it is necessary to understand the risks encountered in the actual application of information management in detail, and make clear the losses brought by information management risks to the database. Therefore, from the practical point of view, in order to improve the security of the database system, we should fully consider the various practical problems faced by the computer database technology in the application program.

4.4 Combination of Theory and Practice of Computer Database Technology

In the application of computer database technology in information management, it is necessary to strengthen the theory and practice of computer database technology according to the level of information management. In the specific implementation of computer database technology, the application level of computer database technology is increasing. The actual demand of the computer database technology, in order to make clear the information management, this technology is the application case of the computer database technology of the information management, analyzing and mastering the combination of the theory and the computer database technology, which is of great importance in the combination of the theory and practice of the computer database technology.

Therefore, the applicability of computer database technology is constantly improving, and computer database technology has been used in enterprise information management.

5. Conclusion

In the current social development process, China is still in the primary stage of socialism. However, with the support of economic and cultural prosperity, China's science and technology has been widely innovated and applied. After the innovation of science and technology, computer database technology has gradually become an important computer technology. Taking the computer database technology in information management as the goal and the computer database technology in information management as the center, the security of the computer database technology in information management is improved. This paper combines the research and application of database, computer, database technology and practicability, strengthens the relevant content of computer database technology, and discusses the future development of information management through beneficial inspiration.
